JSP Actions
JSP Backing Beans

Traduction en cours

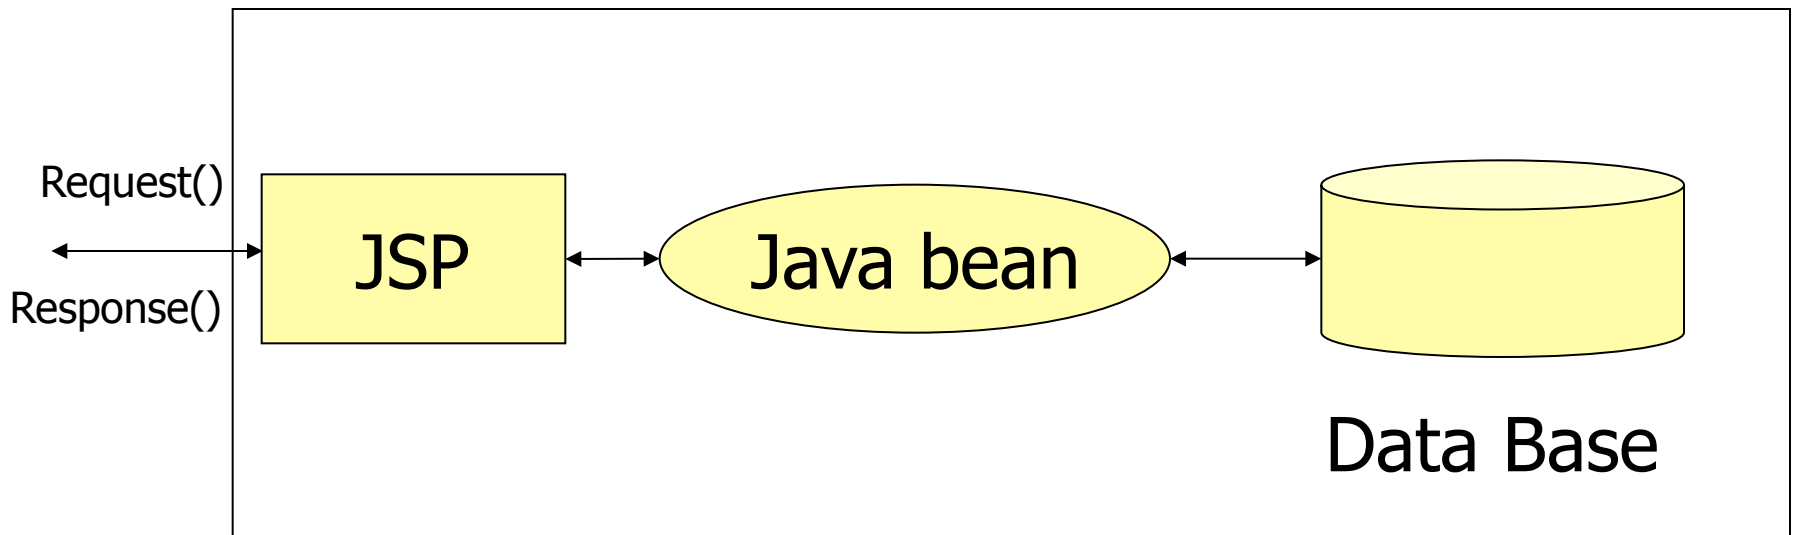

JSP Actions

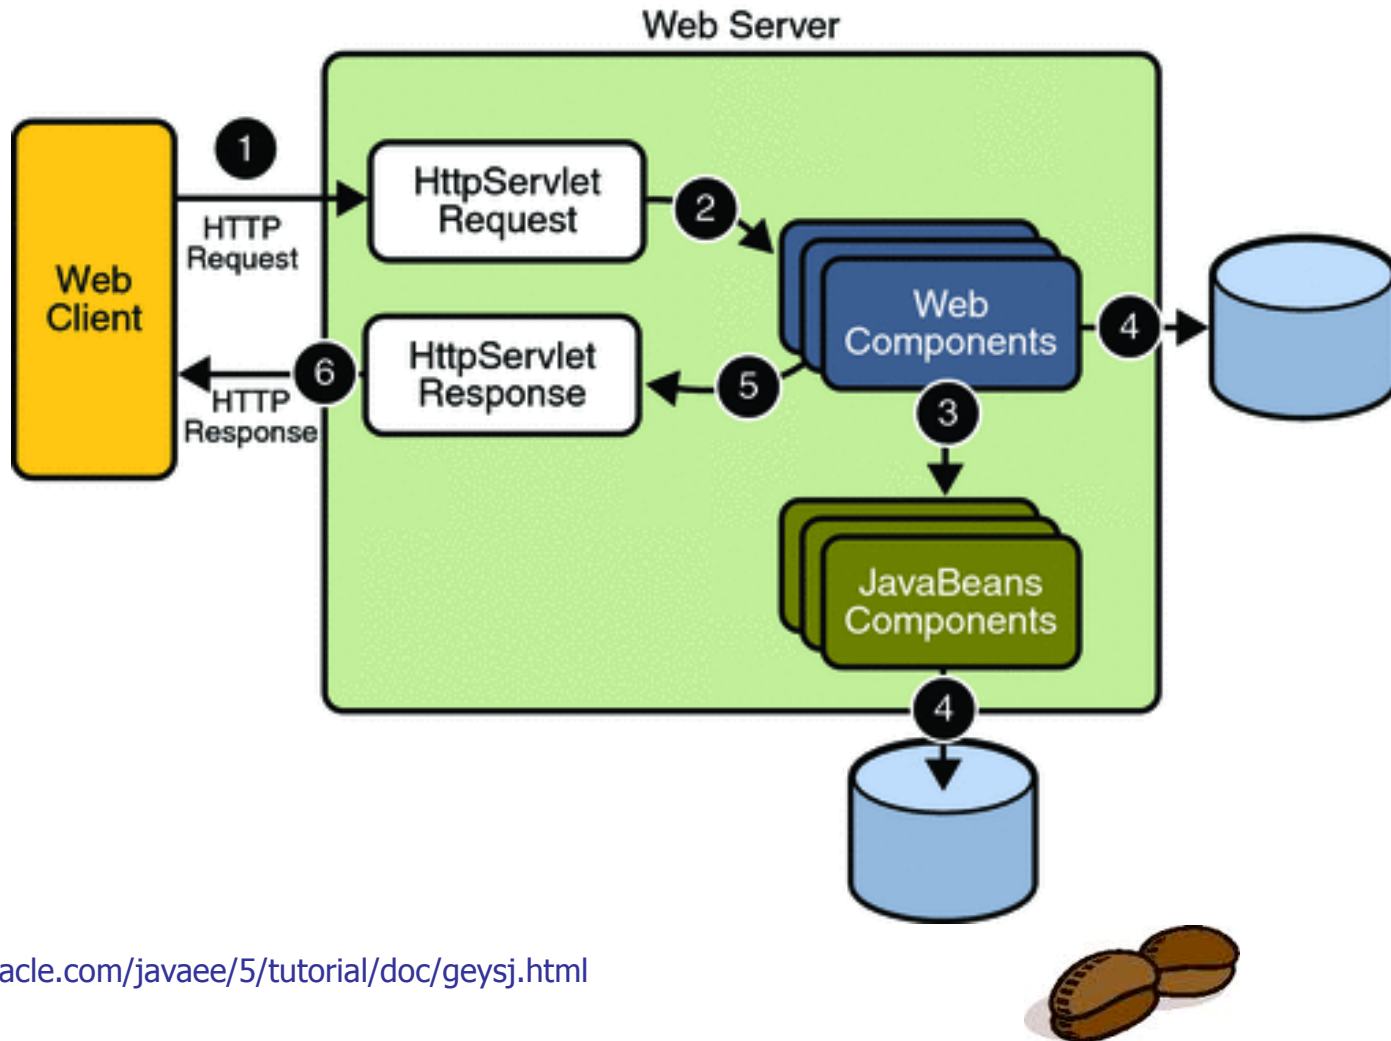

- JSP Actions are XML tags that can be used in the JSP page
- *JSP tag lib*

JSP and Java Bean

The Java EE 5 Tutorial

<http://docs.oracle.com/javaee/5/tutorial/doc/geysj.html>

JSP Actions

- `<jsp:include/>`
- `<jsp:forward/>`
- `<jsp:plugin/>`
- `<jsp:usebean/>`
- `<jsp:setProperty/>`
- `<jsp:getProperty/>`

JavaBean related actions

- `<jsp:useBean/>`
 - find or instantiate a JavaBean
- `<jsp:setProperty/>`
 - sets the property of a JavaBean
- `<jsp:getProperty/>`
 - gets the value of a JavaBean property

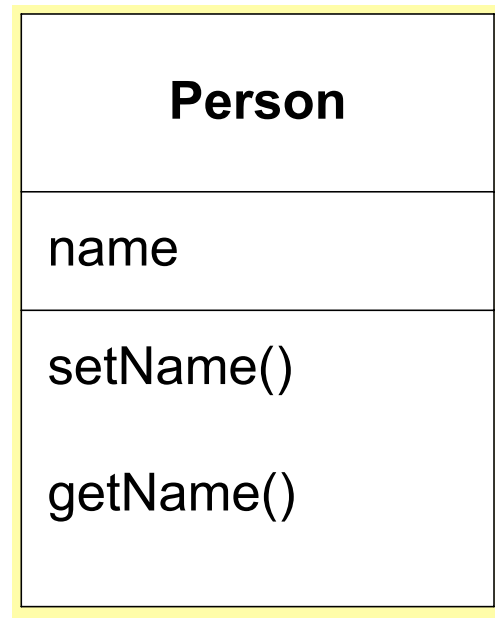

<jsp:useBean> JSP Action tags

- The useBean action declares a JavaBean for use in a JSP.
- The bean becomes a scripting variable that can be accessed by both scripting elements and other custom tags used in the JSP.
- The full syntax for the useBean tag is as follows:
 - The <jsp:useBean> element locates or instantiates a JavaBeans component.
 - <jsp:useBean> first attempts to locate an instance of the Bean.
 - If the Bean does not exist, <jsp:useBean> instantiates it from a class or serialized template.

Person Bean

<jsp:useBean>

```
<jsp:useBean
  id="beanInstanceName"
  scope="page | request | session | application"
  {
    class="package.class" |
    type="package.class" |
    class="package.class" type="package.class" |
    beanName="{package.class | <%= expression %>}" type="package.class"
  }
  {
    /> |
    > other elements </jsp:useBean>
  }
```

<jsp:useBean>

<jsp:useBean

id="*beanInstanceName*"

scope="**page** | request | session | application"

{

class="*package.class*" |

type="*package.class*" |

class="*package.class*" type="*package.class*" |

beanName="{*package.class* | ~~<% = expression %>~~}" type="*package.class*"

}

{

/> |

> *other elements* </jsp:useBean>

}

Package Mandatory

<jsp:useBean>

```
<jsp:useBean id = "Person" class = "bean.Person" scope = "session" />
```

Package Mandatory

<jsp:useBean>

<jsp:useBean

id="*beanInstanceName*"

scope="**page** | request | session | application"

{

class="*package.class*" |

type="*package.class*" |

class="*package.class*" type="*package.class*" |

beanName="{*package.class* | <%= expression %>}" type="*package.class*"

}

{

/> |

> *other elements* </jsp:useBean>

}

EJB session Bean

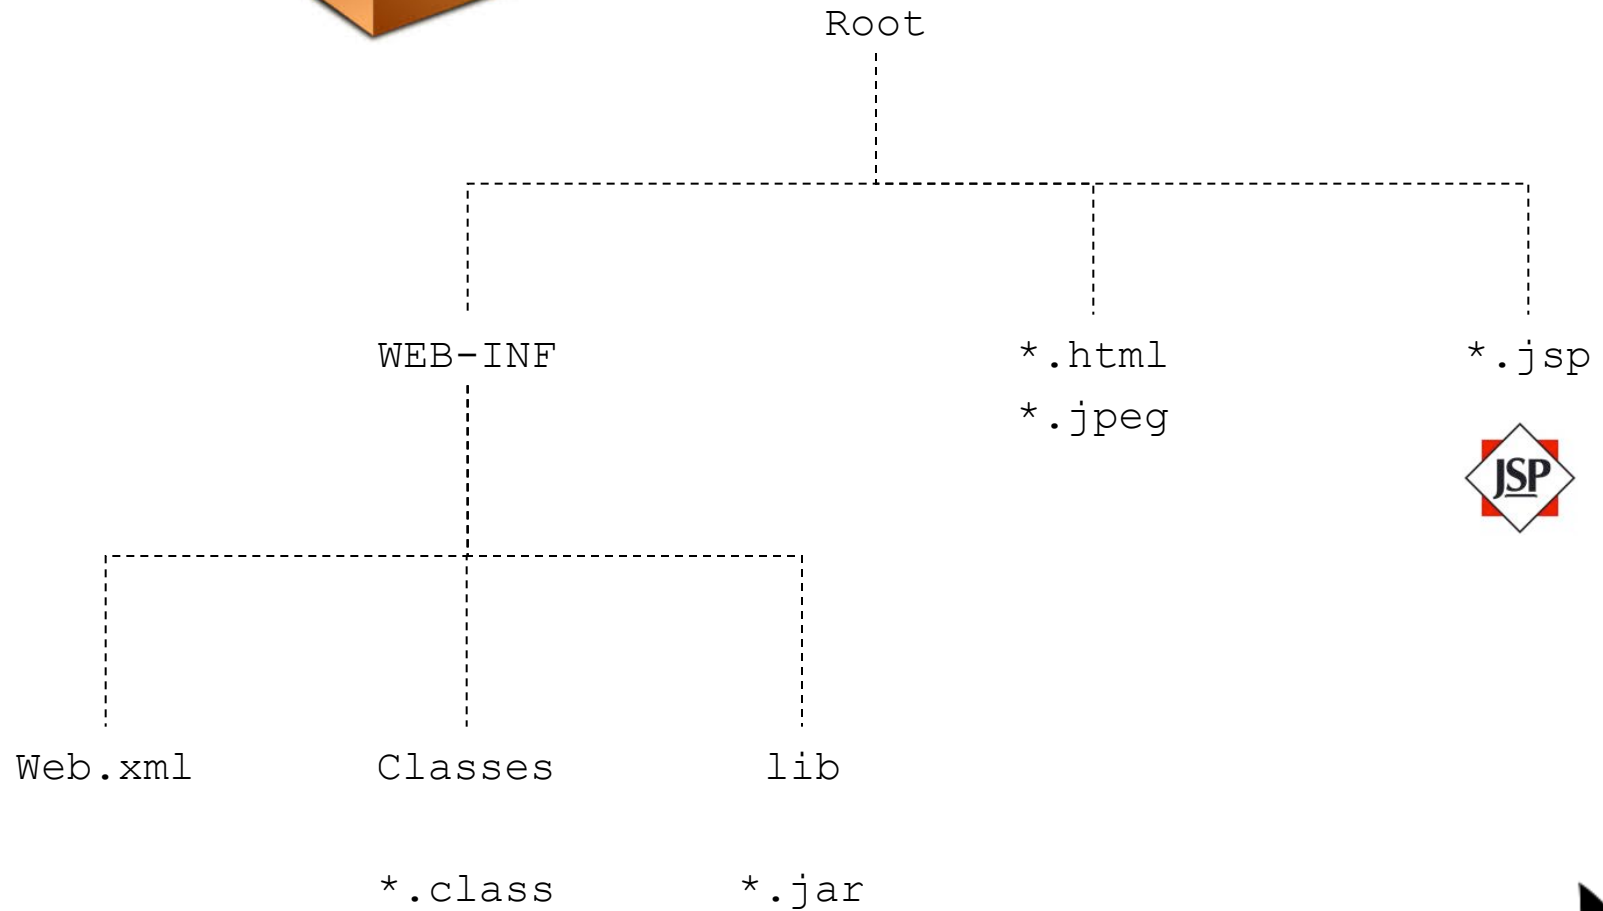

<jsp:setProperty/> <jsp:getProperty/>

```
<jsp:setProperty name="bean" property="propertyName" value="val" />  
<jsp:getProperty name="bean" property="propertyName" />
```

WAR

JSP and Java Bean example

JSPbean

Person

Person bean

```
package bean;

public class Person implements java.io.Serializable
{
    private String firstName = null;
    private String lastName = null;

    public Person() {
    }
    public String getFirstName(){
        return firstName;
    }
    public String getLastName(){
        return lastName;
    }

    public void setFirstName(String firstName){
        this.firstName = firstName;
    }
    public void setLastName(String lastName){
        this.lastName = lastName;
    }
}
```

Person.java

Person bean

A screenshot of the Eclipse IDE interface. The title bar reads "Java EE - JSPbackedBean/src/bean/Person.java - Eclipse - /Users/emmanuelfuchs/eclipseTemplate". The interface is divided into several panes. On the left, the "Project Explorer" shows a tree structure for "JSPbackedBean", including "src", "bean", and "Person.java". The "Type Hierarchy" pane is also visible. The main editor pane displays the code for "Person.java", which is a Java class implementing the "Serializable" interface. The code includes package declarations, imports, and methods for getting and setting first and last names. The bottom of the IDE features a "Properties" pane and a "Servers" pane. The status bar at the very bottom indicates the current file is "bean.Person.java - JSPbackedBean/src".

```
package bean;

import java.io.Serializable;

public class Person implements Serializable
{
    private String firstName = null;
    private String lastName = null;

    public Person() {
    }

    public String getFirstName(){
        return firstName;
    }

    public String getLastName(){
        return lastName;
    }

    public void setFirstName(String firstName){
        this.firstName = firstName;
    }

    public void setLastName(String lastName){
        this.lastName = lastName;
    }
}
```

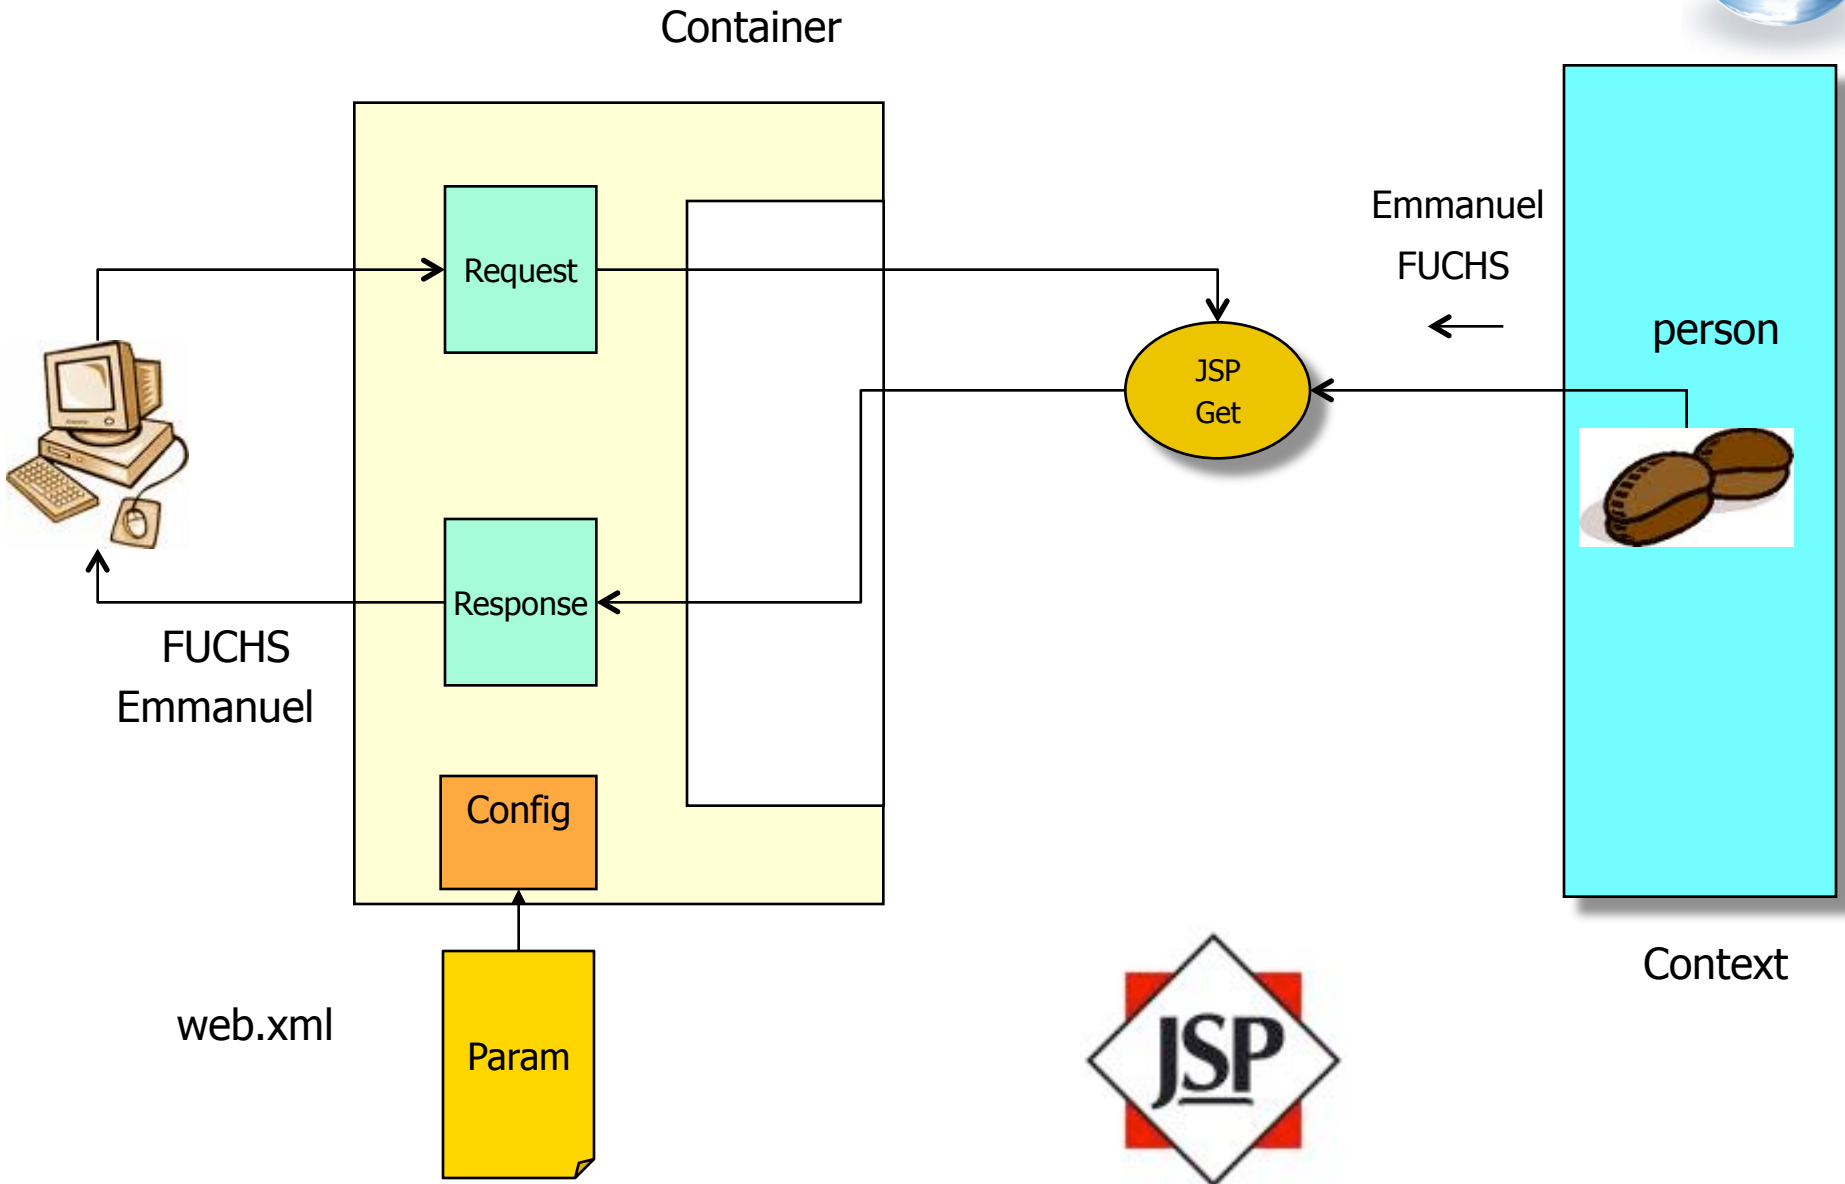

JSP SET GET

1

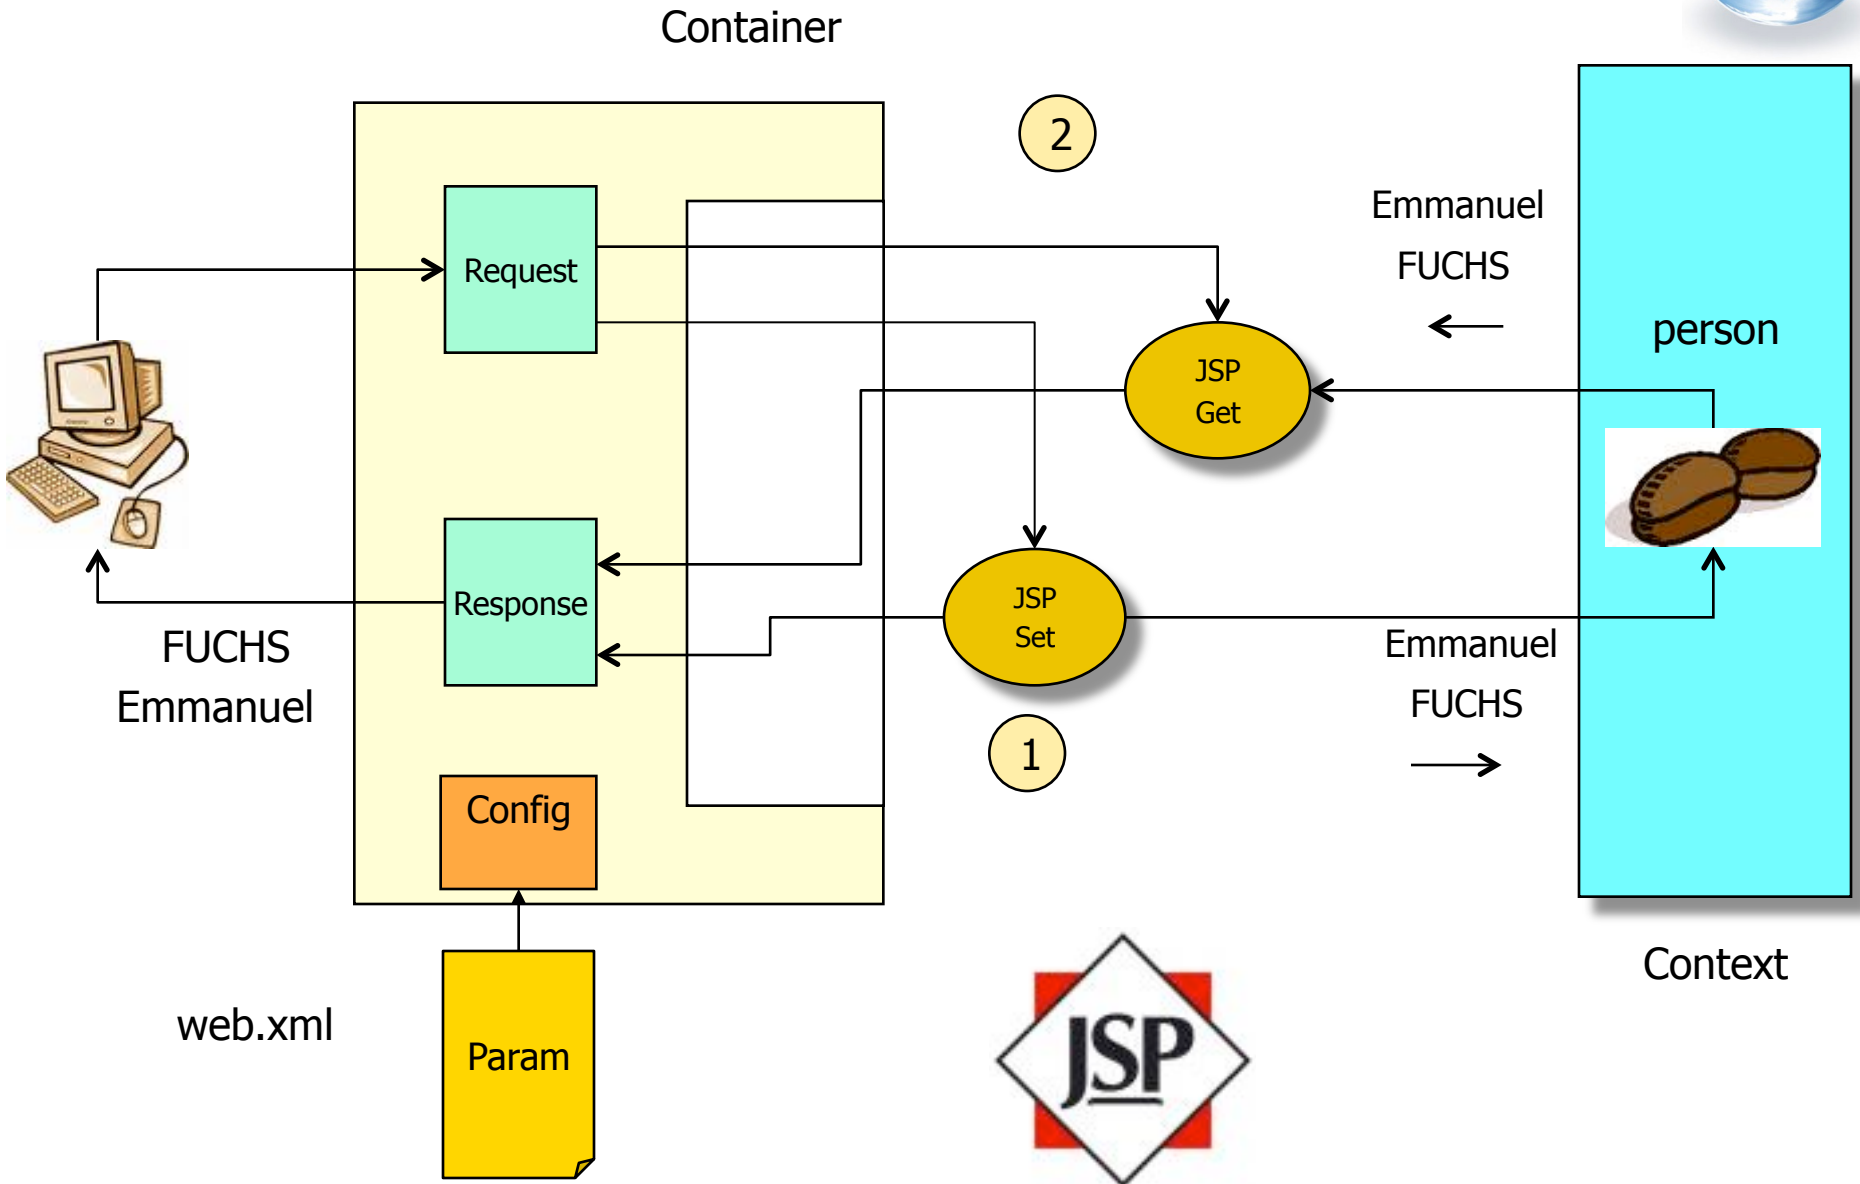

JSP SET GET

2

JSP SET GET

JSPbeanSet.jsp

```
<jsp:useBean id="Person" class="bean.Person" scope="session"/>  
  
<jsp:setProperty name="Person" property="firstName" value="emmanuel"/>  
  
<jsp:setProperty name="Person" property="lastName" value="fuchs"/>
```

The generated Servlet stores the Person bean in the Servlet Context

JSPbeanSet.jsp

Java EE – JSPbackedBean/WebContent/JSPBeanSet.jsp – Eclipse – /Users/emmanuelfuchs/eclipseTemplate
